

Description:

For many years ATC has designed and fabricated noise enclosures. The design is done in close cooperation with our customers, since these enclosures must be custom made to fit each application.

This particular enclosure is custom designed to reduce noise from three large pumps. The enclosure is made from stainless steel, and delivered as a flat packed unit.

The elements had to be transported in to a platform leg and assembled on site.

ATC have done all engineering, fabrication and test assembly of this enclosure.
